

# Cultural Capital Organiser - Harden Beck

Year 5

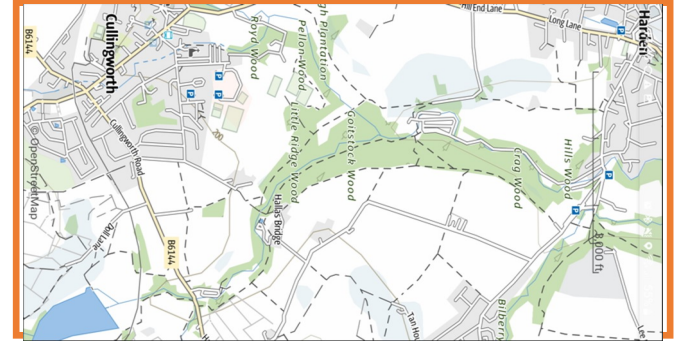

Goit Stock Waterfall

**Harden Beck** - Harden Beck is a stream that flows from the source of the river at Hewenden Reservoir, over Goit Stock Waterfall to the mouth of the river - River Aire in Bingley, West Yorkshire.

**History** - There were six mills on the beck, producing silk and other materials. Sadly, all of which have been destroyed or turned into something different like housing accommodation or cafes.

## Goit Stock

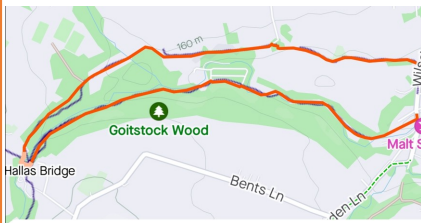

Goit Stock Waterfall (within Goit Stock Woods) is the most well-known feature of Harden Beck. The waterfall stands at 20ft high and was previously known as Hallas Lumb until it changed in 1820s.

**Broadleaf deciduous woodland** - the woods are known for being a broadleaf woodland. Keep an eye out for jays and woodpeckers!

## Key Vocabulary

|                    |                                                                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mouth of a river   | The point where the river ends. It may flow into a sea, lake or ocean.                                                                                                                                                                                        |
| Source of a river  | Where the river begins                                                                                                                                                                                                                                        |
| Waterfall          | A feature in the upper course. Created because the river erodes softer rock leaving overhanging harder rock that the river falls/ travels over. They have a deep pool called a plunge pool at their base which is eroded due to water and rocks in the water. |
| River              | A river is a large, continuous stretch of fresh water flowing in a channel across land, to a larger river, a lake or the sea.                                                                                                                                 |
| Deciduous woodland | Trees and shrubs that lose their leaves during the winter                                                                                                                                                                                                     |
| Upper course       | The first stage of river, often located on high ground.                                                                                                                                                                                                       |
| Beck               | A synonym for stream                                                                                                                                                                                                                                          |
| Tributary          | Small streams that join a larger river                                                                                                                                                                                                                        |
